**8 kg**  
**(17.6 lbs)**  
RATED

\* The clamp material is made of PC+Glass Fiber, offering high strength and high rigidity. It can withstand strong fastening forces without easily deforming. The clamped object is typically made of durable alloy steel, such as support poles for office partitions, center poles of existing monitor stands, or poles used in fitness equipment and dental examination chairs. When tightening, it only needs to be securely fastened to the pole to prevent the monitor from slipping or wobbling during adjustment. Avoid excessive clamping that could deform the pole or leave marks and paint damage.
